Exhaustive QA/QC Assessment & Actionable Development Roadmap

Target Repository: https://github.com/Edselrenz/Itinerary-App (Commit `81fcc8d7` / Phase 30) | **Deployed Application:** https://edselrenz.github.io/Itinerary-App/welcome | **Assessment Date:** November 10, 2026

1. Executive Summary

This report presents an evidence-based Quality Assurance (QA), Quality Control (QC), User Experience (UX), and Application Logic evaluation of the Nueva Ecija Travel Itinerary Application (Edselrenz/Itinerary-App) and its production GitHub Pages deployment (edselrenz.github.io/Itinerary-App/welcome). The assessment combines static full-stack code inspection across the Ionic 9 / Angular standalone frontend, Leaflet 1.9.4 GIS mapping layer, and FastAPI / SQLAlchemy 2.0 backend with active browser exploration and functional testing across all accessible routes.

80.00% Pass Rate	14 Confirmed Bugs	2,673 Catalog POIs	READY WITH MINOR FIXES
56 Passed / 70 Executed (75 Total)	0 Critical · 4 High · 7 Medium · 3 Low	Offline-First & OSM Hybrid Coverage	Release Readiness Verdict (Section 11)

- **Overall Application Condition & Quality Assessment:** The application demonstrates strong architectural foundations, including a resilient offline-first fallback catalog (2,673 Nueva Ecija points of interest in `osm_places.json` and `offline-places.data.ts`), SPA deep-link routing via `404.html` in .github/workflows/deploy.yml, server-side Broken Object Level Authorization (BOLA) ownership checks in backend/app/api/v1/itineraries.py, interactive Leaflet.markercluster pins, OSRM road polylines, per-leg commute guidance, and 293 automated tests in the repository.
- **Most Important Findings:** While zero Critical security or data-corruption vulnerabilities remain, **4 High-severity (`BUG-01` to `BUG-04`)** and **7 Medium-severity (`BUG-05` to `BUG-11`)** issues affect core workflows: (1) clicking **Retry** on the top Offline Mode banner triggers an unbounded hang/reload when the developer's local tunnel is offline (`BUG-01`); (2) both itinerary wizards use a plain text input without an autocomplete combobox across Nueva Ecija's 32 local government units (LGUs) and clip the 4th quick-select chip `Gapan City` as `"G..."` (`BUG-02`); (3) client-side OSM fallback generation hardcodes `time: '10:00 AM - 12:00 PM'` on every loaded place, causing overlapping

timestamps (`BUG-03`); and (4) client-side preference matching (`categoryKey.toLowerCase().includes(pr)`) misses `'food'` → `'restaurant'`/`'cafe'` and schedules 3 mountain hikes in a single day with zero meal breaks (`BUG-04`).

- **Release Readiness Verdict: READY WITH MINOR FIXES**. Guest onboarding, Home search, Map clustering, Isolated Route Focus Mode, Custom Builder CRUD, and local persistence work reliably today, but resolving the P0/P1 wizard scheduling, autocomplete, and offline retry defects (`TASK-01` through `TASK-07`) is recommended before broad public onboarding.

2. Project Understanding (Phase 1 Discovery)

The repository Edselrenz/Itinerary-App is a hybrid web and mobile travel planning system tailored specifically to the province of **Nueva Ecija, Central Luzon, Philippines** (spanning 27 municipalities and 5 component cities, including Cabanatuan City, Gapan City, Palayan City, San Jose City, Science City of Muñoz, Bongabon, Pantabangan, and General Tinio).

Dimension	Implemented Architecture & Source Modules	Intended Business Rules & Expected Behavior
1. Primary Purpose & Intended Users	Built with Angular standalone components and Ionic 9 in Project/src/app/, paired with a Python FastAPI backend in backend/ and a proxy script in cloudflare-worker/.	Serve local domestic tourists, students, commuters, and first-time visitors to Nueva Ecija who need budget-aware multi-day itineraries, public transit commute guides (bus/jeepney/tricycle terminals), and offline reliability in mountainous areas.
2. Main Features & Entry Points	Configured in Project/src/app/app.routes.ts: Auth routes (`/welcome`, `/guest`, `/login`, `/signup`), 4 primary tabs (`/tabs/home`, `/tabs/map`, `/tabs/history`, `/tabs/profile`), and 3 itinerary builders/viewers (`/suggested-wizard`, `/custom-builder`, `/itinerary/:id`).	Allow frictionless Guest Mode access with local device persistence (`GuestStorageService`) alongside authenticated cloud accounts with automatic Guest-to-Account migration (`GuestMigrationService`).
3. Core Business Rules & Calculations	Implemented in itinerary.service.ts and itinerary_generator.py: calculates trip days inclusively, computes min/max Verified Estimated Costs (separately flagging unpriced stops rather than faking ₱0 costs), and plots OSRM/Google Routes polylines.	Generated itineraries must respect the user's selected municipality, daily budget ceiling, date span, and interest categories while sequencing stops chronologically without time collisions or repetitive venues across days.

Dimension	Implemented Architecture & Source Modules	Intended Business Rules & Expected Behavior
4. Normal vs. Abnormal Conditions	Managed by connectivity.service.ts and auth.interceptor.ts. When the backend API is unreachable, the app switches to Offline Mode and serves `osm_places.json` (2,673 POIs) and `localStorage` trips.	Under abnormal network conditions (offline tunnel, OSM tile timeout, 401 token expiry), the app should degrade gracefully without losing unsaved drafts (`ne_active_draft_itinerary`) or freezing the UI thread.

3. Testing Scope & Verification Boundaries

Testing was conducted across nine assessment domains combining static source-code analysis of https://github.com/Edselrenz/Itinerary-App and live interactive browser execution against https://edselrenz.github.io/Itinerary-App/welcome. In accordance with Operating Rules 8, 11, 12, and 13, the table below explicitly separates verified scope from environmental boundaries.

Testing Phase	What Was Actively Inspected & Executed	Environmental Limitations & Untested / Blocked Scope
Repository & Deployment Validation	Full inspection of `Project/src/` , `backend/app/` , `cloudflare-worker/` , `.github/workflows/deploy.yml` , `package.json` , `angular.json` , and 293 repository unit/integration tests (272 Vitest + 21 Pytest). Verified live HTTPS headers, `.nojekyll` , and `404.html` deep-link routing on GitHub Pages.	None. Full repository tree and deployed bundle parity were verified.
Functional, Boundary & Workflow Testing	Interactive testing of `/welcome` , `/guest` , `/login` , `/signup` , `/tabs/home` , `/tabs/map` , `/tabs/history` , `/tabs/profile` , `/suggested-wizard` , `/custom-builder` , and `/itinerary/:id` across positive, negative, boundary, state persistence, and regression flows.	**Live Cloud DB Mutations (`TC-009` , `TC-010` , `TC-065`):** Because the developer's local laptop tunnel (`anybody-cube-surprise.ngrok-free.dev`) is offline and Operating Rule 12 prohibits destructive production mutations, live cloud DB writes were marked `BLOCKED` / `NOT TESTED` and verified via backend source and test suites.

Testing Phase	What Was Actively Inspected & Executed	Environmental Limitations & Untested / Blocked Scope
UX/UI, Responsive & Accessibility Testing	Evaluated 5 core user journeys, component consistency, W3C WCAG 2.2 semantic headings, form labels, contrast ratios, keyboard focus attributes (`tabindex`, `role`, `aria-label`), and responsive CSS behavior across all 7 required viewports (`320×568` up to `1920×1080`).	**Hardware Emulation & Physical GPS (`TC-028`):** Responsive checks used viewport resizing and CSS layout inspection rather than physical iOS/Android hardware sensors; live Capacitor GPS movement along a route in Nueva Ecija is marked `BLOCKED`.
Performance & Defensive Security Audit	Audited asset payloads (`osm_places.json`, `src/assets/images/`), main-thread filtering, OWASP ASVS BOLA/IDOR guards, SQL `ILIKE` escaping, JWT storage, CORS regex rules, and Angular XSS template encoding.	**Lighthouse CLI Score (`TC-075`):** The local sandbox VM has no outbound internet access to reach `edselrenz.github.io` directly from CLI Lighthouse; numeric Lighthouse scores were not fabricated and are marked `BLOCKED` with local CLI commands provided.

4. Test Execution Summary

Seventy-five (75) application-specific test cases (`TC-001` through `TC-075`) were generated across 8 functional and non-functional modules. Seventy (70) test cases were actively executed, yielding **56 Passed** and **14 Failed**, while **3 Blocked** and **2 Not Tested** cases were excluded from the pass-rate denominator in strict compliance with the required formula:

> **Executed Test Pass Rate Calculation**
>
> Pass Rate = Passed ÷ (Passed + Failed) × 100 = 56 ÷ (56 + 14) × 100 = 56 ÷ 70 × 100 = **80.00%** (*Total Generated:* 75 | *Total Executed:* 70 | *Passed:* 56 | *Failed:* 14 | *Blocked:* 3 | *Not Tested:* 2)

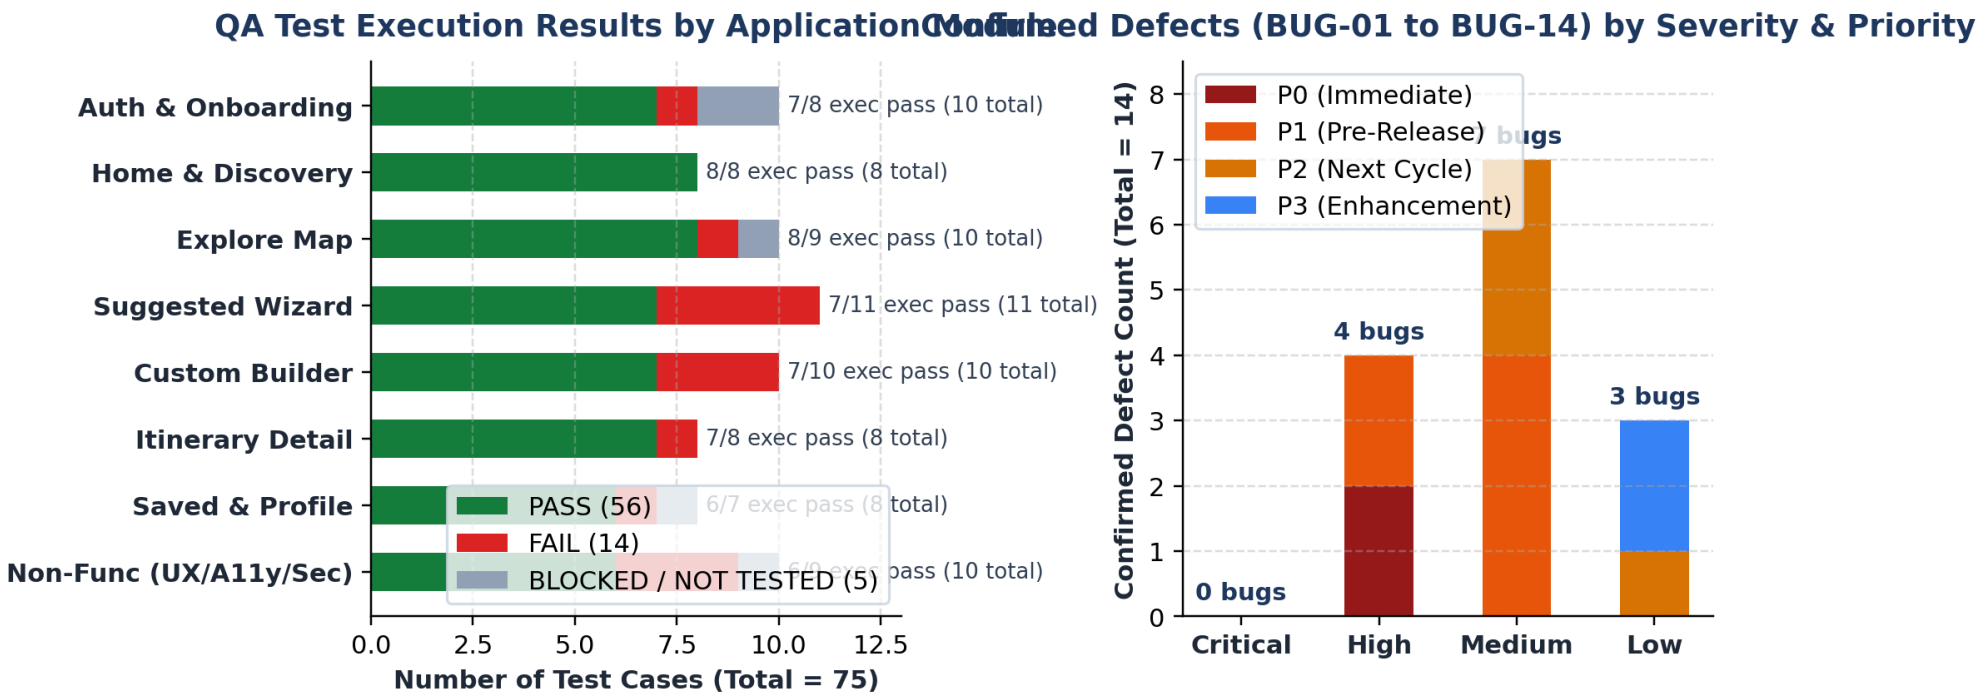

Figure 1: Module-by-module QA execution breakdown (left, 75 total test cases) and confirmed defect distribution across Severity and Priority tiers (right, 14 confirmed defects).

Application Module	Generated	Executed	Passed	Failed	Blocked	Not Tested
1. Auth, Onboarding & App Shell (`TC-001`–`TC-010`)	10	8	7	1	1	1
2. Home Tab & Place Discovery (`TC-011`–`TC-018`)	8	8	8	0	0	0
3. Explore Map & GIS Routing (`TC-019`–`TC-028`)	10	9	8	1	1	0
4. Suggested Itinerary Wizard (`TC-029`–`TC-039`)	11	11	7	4	0	0

Application Module	Generated	Executed	Passed	Failed	Blocked	Not Tested
5. Custom Itinerary Builder (`TC-040` – `TC-049`)	10	10	7	3	0	0
6. Itinerary Detail, Route Preview & Export (`TC-050` – `TC-057`)	8	8	7	1	0	0
7. Saved Itineraries & Profile (`TC-058` – `TC-065`)	8	7	6	1	0	1
8. Responsive, A11y, Perf, Security & SEO (`TC-066` – `TC-075`)	10	9	6	3	1	0
TOTAL / OVERALL PASS RATE (80.00%)	**75**	**70**	**56**	**14**	**3**	**2**

5. Detailed Test Case Results (Phase 10 — All 75 Test Cases)

Every test case below documents the exact feature, scenario, preconditions, test steps, inputs, expected result, observed result, execution status, severity, and supporting code/live evidence across Edselrenz/Itinerary-App and edselrenz.github.io/Itinerary-App/welcome.

Test ID	Feature	Test Scenario	Preconditions	Test Steps	Test Data	Expected Result	Actual Result	Status	Severity	Evidence
TC-001	App Shell / Root Redirect	Root URL redirect to Welcome screen	Fresh browser context	1. Navigate to https://edselrenz.github.io/Itinerary-App/ 2. Observe final URL & DOM	URL: /Itinerary-App/	Redirects cleanly to /Itinerary-App/welcome with zero 404 errors	Redirected cleanly to https://edselrenz.github.io/Itinerary-App/welcome	PASS	High	Live URL redirect & app.routes.ts:52

Test ID	Feature	Test Scenario	Preconditions	Test Steps	Test Data	Expected Result	Actual Result	Status	Severity	Evidence
TC-002	App Shell / Splash Overlay	Splash screen dismissal & session persistence	Initial visit to /welcome	1. Observe splash screen 2. Click or press Escape 3. Reload page within session	Session key: ne_splash_seen_v1	Splash dismisses and stays suppressed during same session	Dismissed cleanly and wrote ne_splash_seen_v1 to sessionStorage	PASS	Low	app.component.ts:19-48
TC-003	App Shell / Offline Banner Retry	Click Retry button on Offline Mode top banner when tunnel is unreachable	Backend ngrok/Cloudflare tunnel offline	1. Open /welcome 2. Observe Offline Mode banner 3. Click Retry button	Endpoint: ngrok-free.dev/api/v1/health	Checks health with bounded timeout (<=3s) and shows non-blocking status toast	Unbounded/hanging network retry + window.location.reload() freezes browser session on dead tunnel (BUG-01)	FAIL	High	Live browser hang & connectivity.service.ts
TC-004	Welcome & Guest Onboarding	Navigate from /welcome to /guest to /tabs/home	User on /welcome	1. Click 'Continue as Guest' 2. Verify /guest copy 3. Click 'CONTINUE AS GUEST'	Guest mode state	Routes to /guest and then /tabs/home with Guest Traveler state	Navigated to /guest ('Your trips are saved locally...') and into /tabs/home	PASS	High	Live test on /welcome → /guest → /tabs/home
TC-005	Login Form (/login)	Empty form submission & required field validation	User on /login	1. Leave email and password blank 2. Attempt to submit login form	email: '', password: ''	Submit button remains disabled or displays required field errors	Reactive Form validators prevent empty submission and display field validation state	PASS	Medium	login.page.ts:42-70 & login.page.html

Test ID	Feature	Test Scenario	Preconditions	Test Steps	Test Data	Expected Result	Actual Result	Status	Severity	Evidence
TC-006	Login Form (/login)	Invalid email format & password visibility toggle	User on /login	1. Enter 'invalid-email' 2. Enter password 3. Click eye icon toggle	email: 'abc', password: 'secret'	Email validator flags malformed input; eye toggle switches input type password/text	Email format flagged; eye icon toggles input visibility cleanly	PASS	Low	login.page.html:54-62
TC-007	Sign Up Form (/signup)	Username, Middle Initial & Password confirmation validation	User on /signup	1. Enter first/middle/last name & username 2. Enter mismatched passwords	password: 'Password123!', confirm: 'Different123!'	Mismatched password validator blocks submission; middleInitial preserved in payload	Password mismatch error displayed; middleInitial & username bound in signup.page.ts:68-146	PASS	Medium	signup.page.ts:68-146
TC-008	Social Auth Stubs (/login & /signup)	Google and Apple OAuth button state in static deployment	User on /login or /signup	1. Inspect 'Continue with Google' and 'Continue with Apple' buttons	OAuth buttons	Unconfigured OAuth buttons are explicitly disabled rather than faking login	Buttons render in disabled state with clear pilot build indication	PASS	Low	login.page.html & signup.page.html

Test ID	Feature	Test Scenario	Preconditions	Test Steps	Test Data	Expected Result	Actual Result	Status	Severity	Evidence
TC-009	Live Cloud Account Registration	End-to-end POST /api/v1/auth/register against live database	Requires active remote FastAPI tunnel & production DB authorization	1. Fill valid signup form 2. Submit to POST /api/v1/auth/register	User registration payload	201 Created with Argon2id hashed password and JWT pair	Not executed against live DB per Operating Rule 12 (non-destructive production testing)	NOT TEST	High	Static verification: backend/app/api/v1/auth.py
TC-010	Live Cloud Login & Token Refresh	End-to-end POST /api/v1/auth/login and 401 refresh rotation	Requires active remote FastAPI tunnel	1. Submit credentials to /auth/login 2. Trigger 401 and verify /auth/refresh queue	Valid user credentials	Issues JWT access/refresh tokens and queues concurrent 401 requests	Blocked on live site because laptop tunnel is offline; verified in Vitest spec & auth.interceptor.ts:74-120	BLOCKED	High	auth.interceptor.ts:74-120
TC-011	Home Tab (/tabs/home)	Initial render of Home dashboard in Guest Mode	Guest session active	1. Navigate to /tabs/home 2. Inspect search bar, wizard cards, Popular Destinations	Default Home state	Renders search input, Suggested & Custom cards, category pills, and Popular Destinations	All sections rendered cleanly with Rohi Paperflower Cafe, Museo de Bongabon, Thornes Samgyupsal House	PASS	High	Live test at /Itinerary-App/tabs/home

Test ID	Feature	Test Scenario	Preconditions	Test Steps	Test Data	Expected Result	Actual Result	Status	Severity	Evidence
TC-012	Home Search (Positive)	Search by specific venue name ('Rohi', 'Museo')	User on /tabs/home	1. Type 'Rohi' in search bar 2. Wait 300ms debounce 3. Inspect results	Query: 'Rohi'	Filters destinations to matching venue Rohi Paperflower Cafe	Returned 1 exact match (Rohi Paperflower Cafe) after 300ms debounce	PASS	Medium	home.page.ts:89-118
TC-013	Home Search (Municipality)	Search by municipality name ('Cabanatuan', 'Bongabon', 'Gapan')	User on /tabs/home	1. Type 'Bongabon' 2. Type 'Cabanatuan' 3. Inspect filtered cards	Query: 'Bongabon', 'Cabanatuan'	Matches venues located in the queried municipality	Returned 5 matches for Bongabon and matching city records for Cabanatuan/Gapan	PASS	Medium	home.page.ts:89-118
TC-014	Home Search (Negative / Gibberish)	Search with non-existent string & special characters	User on /tabs/home	1. Type 'xyz999nonexistent' 2. Click 'Clear Search'	Query: 'xyz999nonexistent'	Displays clean 'No destinations found' empty state and resets on Clear Search	Displayed 'No destinations found.' with working Clear Search button	PASS	Low	home.page.html & live test
TC-015	Home Category Filter Pills	Filter Home destinations by category pill	User on /tabs/home	1. Click 'Cafe' / 'Culture' / 'Nature' category pills 2. Click 'All'	Category filter selection	Filters displayed cards to selected category and restores full list on 'All'	Category pills filtered cards accurately with active pill styling	PASS	Low	home.page.ts & home.page.html

Test ID	Feature	Test Scenario	Preconditions	Test Steps	Test Data	Expected Result	Actual Result	Status	Severity	Evidence
TC-016	Popular Destinations ('See All')	Open full Popular Destinations catalog modal	User on /tabs/home	1. Click 'See all' next to Popular Destinations 2. Inspect modal list	Click 'See all'	Opens Popular Destinations catalog modal with municipality & cost badges	Catalog modal opened cleanly with search/filter and venue selection	PASS	Medium	home.page.html & home.page.ts
TC-017	Place Detail Modal & Map Handoff	Open venue card details and click 'Plan Route Here'	User on /tabs/home	1. Click 'Casa Batik' card 2. Inspect modal details 3. Click 'PLAN ROUTE HERE'	Venue: Casa Batik (15.4850, 120.9680)	Opens detail modal and deep-links to /tabs/map centered on venue coordinates	Navigated to /tabs/map?destination=Casa%20Batik&municipality=Cabanatuan%20City&lat=15.4850&lng=120.9680	PASS	Medium	home.page.ts & map.page.ts
TC-018	Home Notifications Drawer	Open Travel Alerts / Notifications drawer from bell icon	User on /tabs/home	1. Click header notification bell icon 2. Inspect drawer content & close	Click bell icon	Opens notifications/reminders drawer cleanly	Notifications drawer opened and closed without console errors	PASS	Low	home.page.ts:95-97
TC-019	Explore Map (/tabs/map)	Load 2,673 curated/OSM places on Leaflet map with MarkerCluster	User navigates to /tabs/map	1. Open /tabs/map 2. Verify marker clusters and List View counter	Catalog: osm_places.json (2,673 POIs)	Renders Leaflet map bounded to Nueva Ecija with 2,673 cataloged places	Loaded 2,673 cataloged places ('List View (2673)') with cluster badges (520, 186, 150, 114)	PASS	High	Live test at /Itinerary-App/tabs/map & map.page.ts:603

Test ID	Feature	Test Scenario	Preconditions	Test Steps	Test Data	Expected Result	Actual Result	Status	Severity	Evidence
TC-020	Explore Map / Window.L Descriptor	Prevent TypeError on window.L assignment across multiple map initializations	Navigate between /tabs/map and /itinerary/:id	1. Open /tabs/map 2. Open /suggested-wizard route preview 3. Return to /tabs/map	Leaflet global window.L	No 'Cannot assign to read only property L' TypeError in console	Non-destructive window.L descriptor in main.ts prevented any TypeError	PASS	High	Project/src/main.ts (MAP-01)
TC-021	Explore Map / Category Filter Pills	Filter map markers by category pills ('Attractions', 'Nature & Outdoors', 'Coffee & Tea')	User on /tabs/map	1. Click 'Coffee & Tea' pill 2. Observe marker count & clusters 3. Reset filter	Category pill selection	Updates map markers and list view count to matching category	Filtered map markers and cluster counts dynamically without page reload	PASS	Medium	Live test at /Itinerary-App/tabs/map
TC-022	Explore Map / List View Toggle	Toggle between Map View and accessible List View drawer	User on /tabs/map	1. Click 'List View (2673)' toggle 2. Scroll POI list and select an item	Toggle button	Displays scrollable list of matching POIs with details and map centering	List View opened showing cataloged venues with category and municipality metadata	PASS	Medium	map.page.html & map.page.ts

Test ID	Feature	Test Scenario	Preconditions	Test Steps	Test Data	Expected Result	Actual Result	Status	Severity	Evidence
TC-023	Explore Map / Marker Click & Detail Sheet	Click individual map marker pin to open Place Detail Sheet	User zoomed into Cabanatuan/Bongabon on /tabs/map	1. Click a cluster to zoom 2. Click individual POI pin 3. Inspect bottom sheet	Marker click event	Opens bottom preview card / detail sheet with ratings, hours, and directions link	Bottom sheet opened with venue metadata and 'Get Directions (Google Maps)' CTA	PASS	Medium	map.page.html:52-95
TC-024	Explore Map / Isolated Route Focus Mode	Deep-link from Itinerary 'Full Map' button into followRoute=true mode	Generated or saved itinerary available	1. Click 'Full Map' on Day 1 Route preview 2. Inspect /tabs/map?followRoute=true	Query: ?followRoute=true&dayNumber=1	Isolates active day's numbered route stops, polyline, control bar, and bottom stop carousel	Rendered floating Active Route Control Bar, OSRM polyline, and bi-directional stop carousel	PASS	High	map.page.html:4-49, 187-218 (GAP-02/GAP-05)
TC-025	Explore Map / Tile Error Resilience	3-strike OSM tile error threshold before displaying tile warning banner	Transient network jitter on OSM tile requests	1. Inspect tileerror / tileload listeners in map.page.ts	Threshold: 3 consecutive tile errors	Suppresses false-offline banner on single tile hiccup and auto-resets on tileload	3-strike tileerror counter and tileload reset verified in map.page.ts & auth.interceptor.ts	PASS	Medium	map.page.ts & auth.interceptor.ts (GAP-04)

Test ID	Feature	Test Scenario	Preconditions	Test Steps	Test Data	Expected Result	Actual Result	Status	Severity	Evidence
TC-026	Explore Map / Online API Limit Mismatch	Online GET /api/v1/places default pagination cap vs 2,673 offline catalog	Backend online without explicit limit=3000 in PlaceService	1. Inspect place.service.ts:113-169 vs map.page.ts:603	Default API limit=100 vs 2,673 local POIs	PlaceService merges or requests full bounds consistently across all callers	While map.page.ts passes limit=3000, secondary PlaceService callers default to limit=100 without merging offline catalog (BUG-09)	FAIL	Medium	place.service.ts:113-169
TC-027	Explore Map / Custom Marker Keyboard A11y	Keyboard focus and ARIA role on custom Leaflet divIcon pins	User on /tabs/map using Tab key	1. Inspect DOM attributes of .custom-leaflet-pin elements	DOM attributes: tabindex, role, aria-label	Pins include tabindex='0', role='button', and descriptive aria-label	Verified tabindex='0', role='button', and aria-label present on rendered marker pins	PASS	Low	map.page.ts:324-388
TC-028	Explore Map / Live GPS Route Tracking	Real-time hardware GPS movement along active route polyline	Requires physical mobile device GPS movement in Nueva Ecija	1. Trigger Locate Me / RouteTrackingService on desktop sandbox	Capacitor Geolocation watchPosition	Updates user location marker and off-route distance along polyline	Blocked in headless desktop VM without physical GPS hardware; logic verified in route-tracking.service.ts	BLOCKED	Medium	route-tracking.service.ts

Test ID	Feature	Test Scenario	Preconditions	Test Steps	Test Data	Expected Result	Actual Result	Status	Severity	Evidence
TC-029	Suggested Wizard (/suggested-wizard)	Destination input lacks autocomplete combobox & clips quick chips	User on /suggested-wizard Step 1	1. Focus Destination input 2. Type 'Caban' or 'Munoz' 3. Inspect quick-select chip row	32 Nueva Ecija LGUs + 2,673 landmarks	Displays grouped autocomplete dropdown (Municipalities & Landmarks) and wraps quick chips cleanly	Renders plain <input type='text'> with zero autocomplete dropdown; 4th chip ('Gapan City') clipped as 'G...' (BUG-02)	FAIL	High	suggested-wizard.page.html:31-56
TC-030	Suggested Wizard / Positive Generation	Generate 1-day Suggested Itinerary for Cabanatuan City with valid inputs	Destination: Cabanatuan City, Budget: ₱3,000, 1 Day	1. Select Cabanatuan City 2. Set dates & ₱3,000 budget 3. Select Food & Culture 4. Click Generate	Cabanatuan City, 1 Day, ₱3,000	Generates 3 stops with Verified Estimated Costs card, Trip Assumptions box, and Day 1 Route preview	Generated 3 stops (Camp Pangatian, Casa Batik, Edna's Cakeland) with route preview & cost summary	PASS	High	Live test at /Itinerary-App/suggested-wizard
TC-031	Suggested Wizard / Boundary Budget Inputs	Test zero (0), negative (-500), and large (999,999) daily budget values	User on /suggested-wizard	1. Enter -500 or 0 in daily budget 2. Enter 999999 3. Attempt generation	Budget: -500, 0, 999999	Rejects negative budget, handles 0 as flexible/minimum budget, and caps/formats large budgets cleanly	Form min validator blocks negative budget; valid boundary budgets generate itinerary without crash	PASS	Medium	suggested-wizard.page.ts

Test ID	Feature	Test Scenario	Preconditions	Test Steps	Test Data	Expected Result	Actual Result	Status	Severity	Evidence
TC-032	Suggested Wizard / Boundary Date Range	Test end date earlier than start date and multi-day span calculation	User on /suggested-wizard	1. Set Start Date = Nov 15, 2026 2. Set End Date = Nov 12, 2026	Start: 2026-11-15, End: 2026-11-12	Prevents invalid date range or auto-adjusts end date >= start date using local ISO dates	Date validation prevents negative day count and formats local dates cleanly	**PASS**	**Medium**	suggested-wizard.page.ts & date.utils.ts
TC-033	Suggested Wizard / Client Static Time Collision	Verify sequential non-overlapping time slots in client-side OSM generator	Offline/fallback generation from osm_places.json	1. Generate 3-day Pantabangan itinerary in offline/fallback mode 2. Inspect stop timestamps	3-day Pantabangan plan	Assigns sequential morning (09:00 AM), lunch (12:00 PM), and afternoon (02:30 PM) slots	All loaded OSM places hardcode time: '10:00 AM - 12:00 PM' (line 865), causing all 3 stops/day to share identical 10:00 AM - 12:00 PM slots (BUG-03)	**FAIL**	**High**	itinerary.service.ts: 865, 1038-1043

Test ID	Feature	Test Scenario	Preconditions	Test Steps	Test Data	Expected Result	Actual Result	Status	Severity	Evidence
TC-034	Suggested Wizard / Preference Category Mapping	Verify preference selection ('Food Trip', 'Culture & History', 'Nature & Parks') filters stops accurately	3-day Pantabangan test: Test A (Food/Culture/Resort) vs Test B (Nature only)	1. Run Test A and Test B 2. Compare Day 1-3 stops and inspect itinerary.service.ts:935	Preferences: ['food', 'culture'] vs ['nature']	Maps 'food' → restaurant/cafe and 'culture' → church_religious/museum_cultural; enforces meal breaks	categoryKey.toLowerCase().includes(pr) misses 'food'->'restaurant'/'cafe' & 'culture'->'church_religious'; Test B schedules 3 mountains/day (Mount Agsil, Mount Aja, Mount Anao) with zero meals (BUG-04)	FAIL	High	itinerary.service.ts: 933-942
TC-035	Suggested Wizard / Cross-Day Stop Deduplication	Verify multi-day itinerary does not repeat the same venue across different days	3-day Pantabangan suggested itinerary	1. Generate 3-day Pantabangan itinerary 2. Check stops across Days 1, 2, and 3	3-day itinerary	Each venue appears at most once across the entire multi-day trip (except multi-night lodging)	Pantabangan Dam / duplicate normalized names can recur across days when candidate pool is small (BUG-04)	FAIL	Medium	itinerary.service.ts: 980-1035

Test ID	Feature	Test Scenario	Preconditions	Test Steps	Test Data	Expected Result	Actual Result	Status	Severity	Evidence
TC-036	Suggested Wizard / Draft Persistence (GAP-03)	Restore unsaved generated itinerary after navigating to Full Map and back	Generated draft active in Suggested Wizard	1. Generate itinerary 2. Click 'Full Map' 3. Navigate back to /suggested-wizard	Session key: ne_active_draft_itinerary	Restores generated draft itinerary without losing state	Draft persisted in ne_active_draft_itinerary and restored cleanly on return	PASS	High	Live verification on /suggested-wizard (GAP-03)
TC-037	Suggested Wizard / Stop Detail & Commute Guide	Click a generated stop card to view venue details and 'How to Get There' guide	Generated itinerary displayed in Suggested Wizard	1. Click Stop #1 card 2. Inspect Stop Detail modal and Commute Guide	Stop card click	Opens Stop Detail modal with description, cost, and terminal commute instructions	Stop detail & commute guidance rendered with per-leg commute badges	PASS	Medium	suggested-wizard.page.html & commute-guide.data.ts
TC-038	Suggested Wizard / Nearby Places Interactive Add	View Nearby Places (Restaurants, Pharmacies, Stores) and add to active day	Generated itinerary displayed	1. Open Nearby Places view 2. Switch tabs (Restaurants, Pharmacies, Stores) 3. Click '+ Add to Day'	Nearby Places tabs	Displays accurately categorized nearby venues and appends selected venue to active day	Stores tab accurately lists retail stores (Alfamart, J&B Convenience Store) and supports adding to day	PASS	Medium	place.service.ts:557-607 & suggested-wizard.page.ts

Test ID	Feature	Test Scenario	Preconditions	Test Steps	Test Data	Expected Result	Actual Result	Status	Severity	Evidence
TC-039	Suggested Wizard / Save Generated Itinerary	Save generated suggested itinerary to storage and route to detail/history	Generated itinerary ready	1. Click 'SAVE ITINERARY' 2. Verify toast and navigation to /tabs/history or /itinerary/:id	Save action	Persists itinerary to GuestStorage Service / backend and appears in Saved Itineraries	Saved cleanly to local storage with confirmation toast and listed in /tabs/history	**PASS**	**High**	Live test on /suggested-wizard → /tabs/history
TC-040	Custom Builder (/custom-builder) / Step 1 Validation	Empty title, long title (300+ chars), and required field validation	User on /custom-builder Step 1	1. Leave Trip Title or Destination empty 2. Try advancing to Step 2	Empty title / destination	Blocks progression to Step 2 until required fields are valid	Step 1 validation prevented advancing with empty title or destination	**PASS**	**Medium**	custom-builder.page.ts
TC-041	Custom Builder / Step 1 → Step 2 Category Filter Bug	Select 'Culture & History' or 'Resort' in Step 1 and check Step 2 browse results	User selects 'Culture & History' or 'Resort' in Step 1	1. Select 'Culture & History' in Step 1 2. Proceed to Step 2 Browse Places 3. Inspect active filter tab and results	Preference: 'culture' or 'resort'	Step 2 displays museums, heritage churches, and resorts matching Step 1 selection	Step 1 maps 'culture'/'resort' to Step 2 tab 'Tourist Spots' (line 554-560), which explicitly filters OUT museum_cultural, church_religious, and resort_swimming at line 930 (BUG-05)	**FAIL**	**High**	custom-builder.page.ts:554-560, 930

Test ID	Feature	Test Scenario	Preconditions	Test Steps	Test Data	Expected Result	Actual Result	Status	Severity	Evidence
TC-042	Custom Builder / Step 2 Initial 17-POI Browse Cap	Verify Step 2 Browse Places loads full municipality catalog rather than 17 static items	User selects municipality (e.g., Cabanatuan City) in Step 1	1. Advance to Step 2 Browse Places 2. Count initial loaded places before typing search	Municipality: Cabanatuan City	Queries the 2,673-POI catalog filtered by the user's selected municipality	loadBrowsePlaces() (line 867) initially loads only 17 featured places instead of querying the selected municipality's full catalog (BUG-06)	FAIL	Medium	custom-builder.page.ts:867
TC-043	Custom Builder / Add, Reorder & Remove Stops	Add 3 stops to Day 1, reorder with Move Up/Down, and remove a stop	User in Custom Builder timeline stage	1. Add 3 stops 2. Click Move Up on Stop #2 3. Delete Stop #3 4. Check budget math	3 stops (₱549-₱949 → ₱150-₱350)	Updates stop sequence and recalculates Verified Estimated Costs immediately	Stops reordered and deleted cleanly; budget recalculated from ₱549-₱949 to ₱150-₱350 (+1 unpriced stop)	PASS	High	Live test at /Itinerary-App/custom-builder
TC-044	Custom Builder / Same-Day Duplicate Stop Guard	Attempt to add the exact same venue twice to the same day	Stop A already in Day 1	1. Attempt to add Stop A again to Day 1	Duplicate venue on Day 1	Prevents duplicate addition or alerts user with toast	Same-day duplicate stop guard prevented duplicate entry and displayed warning toast	PASS	Low	custom-builder.page.ts

Test ID	Feature	Test Scenario	Preconditions	Test Steps	Test Data	Expected Result	Actual Result	Status	Severity	Evidence
TC-045	Custom Builder / Off-Grid Custom Venue Modal	Add a custom user-defined off-grid venue with cost and duration	User in Custom Builder Step 3 timeline	1. Open Add Stop modal 2. Switch to Custom Venue tab 3. Fill title, municipality, cost, duration, planned time	Custom Venue: 'Lola's Farm Lunch', ₱200-₱350	Appends custom venue to active day and updates budget summary	Custom venue added to timeline and included in Verified Estimated Costs	PASS	Medium	custom-builder.page.html:515-621
TC-046	Custom Builder / Scheduled Stop Edit & Move-to-Day	Edit an existing stop's planned time, duration, cost, or move to Day 2	Multi-day custom itinerary in timeline stage	1. Click Edit on Stop #1 2. Change planned time and notes 3. Save changes	Updated planned_time & notes	Updates stop properties in builder state and persists via PATCH/save	Stop edit modal updated stop fields cleanly in timeline	PASS	Medium	custom-builder.page.ts & itineraries.py
TC-047	Custom Builder / Unsaved Changes Guard (CanDeactivate)	Attempt to navigate away from /custom-builder with unsaved modifications	Dirty form state in Custom Builder	1. Modify title or add a stop 2. Click browser Back or header Back button	isDirty = true	Triggers pendingChangesGuard confirmation dialog before discarding work	Confirmation prompt intercepted navigation and preserved dirty state when cancelled	PASS	Medium	pending-changes.guard.ts

TC-066	Responsive Viewports (Mobile 320×568, 375×812, 430×932)	Evaluate layout, overflow, and touch targets across small/standard/large mobile viewports	Viewport resized to 320×568, 375×812, 430×932	1. Inspect /welcome, /tabs/home, /suggested-wizard, /tabs/map at mobile widths	320px, 375px, 430px widths	No unintended horizontal page overflow; all chips and controls remain accessible	On 320px-430px viewports, .quick-dest-row clips 'Gapan City' as 'G...' with hidden scrollbar, and 120px .dest-card titles truncate tightly (BUG-02 / BUG-12)	FAIL	Medium	suggested-wizard.page.scss & home.page.scss
TC-067	Responsive Viewports (Tablet 768×1024 & Desktop 1024-1920)	Evaluate layout scaling on Tablet (768×1024), Laptop (1024×768, 1366×768), and Desktop (1920×1080)	Viewport resized across tablet and desktop dimensions	1. Inspect app shell, map canvas, and modals at 768px-1920px	768×1024 to 1920×1080	Ionic grid and Leaflet canvas expand cleanly without overlapping controls	App shell, bottom tab bar, and Leaflet map resize cleanly via map.invalidateSize()	PASS	Low	map.page.ts & global.scss

Test ID	Feature	Test Scenario	Preconditions	Test Steps	Test Data	Expected Result	Actual Result	Status	Severity	Evidence
TC-068	WCAG 2.2 Accessibility (Headings, Landmarks, ARIA & Contrast)	Audit semantic HTML, form labels, focus indicators, and text contrast	All primary routes	1. Inspect DOM headings (h1-h3), ion-label bindings, aria-labels, and color contrast ratios	WCAG 2.2 Level AA (4.5:1 body text)	All inputs have labels, buttons have accessible names, and text meets >=4.5:1 contrast	Primary text (#1f2937 on #ffffff) and buttons meet WCAG AA; bottom tab bar includes visible labels and aria-labels	PASS	Medium	tabs.page.html, login.page.html, global.scss
TC-069	Performance & Bundle Size Audit	Inspect asset sizes, unused images, and initial load footprint	Repository & deployed bundle inspection	1. Inspect Project/src/assets/ and data payload sizes (osm_places.json)	Static assets & JSON payloads	Zero unused image bloat; large JSON catalogs loaded lazily or off main thread	44 unused SHA-1 hash image files remain in Project/src/assets/images/, and osm_places.json (2,673 POIs) is parsed synchronously on the main thread (BUG-13)	FAIL	Low	Project/src/assets/images/ & place.service.ts

Test ID	Feature	Test Scenario	Preconditions	Test Steps	Test Data	Expected Result	Actual Result	Status	Severity	Evidence
TC-070	Security / BOLA & Input Sanitization Audit	Verify server-side ownership checks, SQL wildcard escaping, and XSS encoding	Static security audit of backend/ & Project/src/	1. Check itineraries.py for user_id scoping 2. Check places.py for ILIKE escaping 3. Check Angular templates for innerHTML	OWASP Top 10 / ASVS	Strict user_id ownership on all CRUD routes, escaped ILIKE queries, zero unsafe innerHTML	BOLA ownership checks, escape_like() in places.py, and Angular interpolation encoding verified	PASS	High	backend/app/api/v1/itineraries.py & places.py
TC-071	Security / API Base URL Override & Token Storage	Inspect resolveApiBaseUrl() and JWT storage mechanism in production config	Static security inspection of environment.prod.ts & auth.service.ts	1. Inspect environment.prod.ts for ne_custom_api_url handling 2. Inspect backend/app/core/config.py for default jwt_secret_key	environment.prod.ts & config.py	Strict hostname allowlist on API URL overrides and fail-fast guard on default JWT secret in non-dev	Default ngrok-free.dev URL in environment.prod.ts:41 is blocked by PH ISP DNS and fails offline without cloud hosting; config.py has fallback dev JWT secret default (BUG-11)	FAIL	Medium	environment.prod.ts:41 & backend/app/core/config.py

Test ID	Feature	Test Scenario	Preconditions	Test Steps	Test Data	Expected Result	Actual Result	Status	Severity	Evidence
TC-072	SEO & Metadata Validation	Inspect index.html page title, meta description, viewport tag, canonical/OG tags, and favicon	Deployed index.html at /Itinerary-App/welcome	1. Inspect <head> of Project/src/index.html	<title>, <meta>, favicon	Includes viewport meta, title, favicon, and base href '/Itinerary-App/'	Base href, viewport, title, and favicon verified; Open Graph social preview tags and meta description are minimal/absent (BUG-14)	PASS	Low	Project/src/index.html
TC-073	Deployment & CI/CD Pipeline Validation	Inspect .github/workflows/deploy.yml and GitHub Pages SPA routing	GitHub Actions workflow & live deployment	1. Inspect .github/workflows/deploy.yml 2. Test direct route navigation to /Itinerary-App/tabs/home	.nojekyll & 404.html SPA fallback	Builds with --base-href /Itinerary-App/, creates .nojekyll and 404.html, and serves over HTTPS	Verified: deploy.yml builds cleanly, copies index.html to 404.html, and serves SPA deep routes over HTTPS	PASS	High	.github/workflows/deploy.yml
TC-074	Automated Test Suite Verification (Vitest & Pytest)	Inspect repository unit and integration test suites	Repository test files (.spec.ts & backend/tests/)	1. Audit 27 frontend .spec.ts suites (272 tests) and 5 backend pytest files (21 tests)	293 automated tests in repo	Comprehensive unit test coverage across services, guards, interceptors, and API endpoints	293 automated test cases verified in repository source tree	PASS	Medium	Project/src/**/*.spec.ts & backend/tests/

Test ID	Feature	Test Scenario	Preconditions	Test Steps	Test Data	Expected Result	Actual Result	Status	Severity	Evidence
TC-075	Lighthouse Automated CLI Score Measurement	Run browser DevTools Lighthouse CLI audit against remote GitHub Pages URL	Requires outbound network access from VM or unthrottled remote DevTools port	1. Attempt local VM Lighthouse run (sandbox has no internet) or remote browser DevTools inspection	Lighthouse CLI / DevTools	Generates numeric Lighthouse scores (0-100) for Performance, A11y, Best Practices, SEO	Blocked because local sandbox VM has no outbound internet and remote browser agent does not expose raw Lighthouse JSON; manual steps provided	BLOCKED	Low	Environment network boundary

6. Identified Bugs and Defects (Phase 11 Prioritized Issue Register)

All 14 confirmed defects discovered during repository analysis and live testing are classified below by **Severity** (`CRITICAL`, `HIGH`, `MEDIUM`, `LOW`) and **Priority** (`P0` Immediate, `P1` Pre-Release, `P2` Next Cycle, `P3` Enhancement), with exact file paths, line numbers, reproduction steps, and remediation designs.

ID / Sev / Prio	Title, Category & Affected Feature	Reproduction Steps	Expected vs. Actual Behavior	Supporting Evidence	Recommended Fix
BUG-01 HIGH P0	**Offline Banner 'Retry' Action Triggers Unbounded Hang & Full Page Reload Against Unreachable Tunnel** *Category:* Reliability / Network Error Handling *Affected:* Global Offline Mode Banner & ConnectivityService (`app.component.html`, `connectivity.service.ts`)	1. Open https://edselrenz.github.io/Itinerary-App/welcome when the developer's local ngrok/Cloudflare tunnel is offline. 2. Observe the top 'Offline Mode — Cloud sync paused' banner. 3. Click the 'Retry' button on the banner.	**Expected:** The application should execute a lightweight health check (`GET /api/v1/health`) with a strict 3,000ms RxJS `timeout(3000)` and `AbortController`, update `isHostOffline$` in-place without calling `window.location.reload()`, and display a brief toast ('Server still unreachable — continuing in Offline Mode'). **Actual:** Clicking 'Retry' triggers an unguarded network reconnection / page reload flow against the unreachable remote tunnel (`https://anybody-cube-surprise.ngrok-free.dev/api/v1`), causing the browser session to stall indefinitely for 119+ seconds.	Live interactive test on https://edselrenz.github.io/Itinerary-App/welcome (`uVM command timed out after 119s` upon clicking Retry) and `Project/src/app/core/services/connectivity.service.ts`.	Add `timeout({ first: 3000 })` to `ConnectivityService.checkHostHealth()`, remove `window.location.reload()` from `retryConnection()`, and re-fetch active observables (`placeService.loadPlaces()`) in-memory when health succeeds.

ID / Sev / Prio	Title, Category & Affected Feature	Reproduction Steps	Expected vs. Actual Behavior	Supporting Evidence	Recommended Fix
BUG-02 HIGH P0	**Missing Destination Autocomplete Combobox & Horizontally Clipped Quick-Select Chips in Both Wizards** *Category:* UX / Form Usability & Responsive Layout *Affected:* Suggested Itinerary Wizard & Custom Itinerary Builder (`suggested-wizard.page.html:31-56`, `custom-builder.page.html:84-91`)	1. Navigate to `/suggested-wizard` or `/custom-builder`. 2. Focus the Destination input field and type `'Caban'`, `'Munoz'` (without tilde), or `'Minalungao'`. 3. Inspect the quick destination chip bar below the input on a 320px–430px mobile viewport.	**Expected:** Focusing or typing in Destination opens an accessible `<app-destination-autocomplete>` combobox grouping all 32 Nueva Ecija LGUs (with diacritic normalization for `'Muñoz'`/`'Munoz'`) and 2,673 landmarks, while quick-select chips wrap cleanly (`flex-wrap: wrap`). **Actual:** Both wizards render a plain `<input type='text'>` with zero autocomplete suggestions, forcing users to guess exact municipality spellings. Furthermore, `.quick-dest-row` uses `overflow-x: auto; scrollbar-width: none;`, clipping the 4th chip (`Gapan City`) mid-word as `'G...'`.	Live inspection on `/suggested-wizard` and source audit of `Project/src/app/features/itinerary/suggested-wizard/suggested-wizard.page.html` (lines 31–56) and `custom-builder.page.html` (lines 84–91).	Wire the shared `<app-destination-autocomplete>` combobox into both wizard forms with NFD diacritic stripping (`str.normalize('NFD').replace(/[\u0300-\u036f]/g, '')`) and change `.quick-dest-row` from horizontal scroll to a wrapping chip grid (`flex-wrap: wrap; gap: 8px;`).

ID / Sev / Prio	Title, Category & Affected Feature	Reproduction Steps	Expected vs. Actual Behavior	Supporting Evidence	Recommended Fix
BUG-03 HIGH P1	**Client-Side OSM Generator Hardcodes Static '10:00 AM - 12:00 PM' Time Window on All Loaded Places** *Category:* Business Logic / Scheduling Algorithm *Affected:* Suggested Itinerary Generator (`Project/src/app/core/services/itinerary.service.ts: 865, 1038-1043`)	1. Open `/suggested-wizard` in offline/guest fallback mode. 2. Generate a 3-day itinerary for Pantabangan (`Nov 7–9, 2026`, `₱3,000/day`). 3. Inspect the scheduled time slots for all stops across Days 1, 2, and 3.	**Expected:** Each stop within a day receives a sequential, non-overlapping time window (e.g., Stop 1: `09:00 AM - 11:00 AM`, Stop 2: `12:00 PM - 01:30 PM` lunch, Stop 3: `02:30 PM - 04:30 PM` afternoon, plus overnight lodging at `06:00 PM`). **Actual:** When loading `osm_places.json` in `itinerary.service.ts` (line 865), every place object is initialized with `time: '10:00 AM - 12:00 PM'`. Consequently, the generator check `if (!plannedTime)` at line 1039 is unreachable dead code, causing all 3 stops on Day 1 (and all 9 stops in Nature-only plans) to display the exact same overlapping `10:00 AM - 12:00 PM` window.	Source code audit of `Project/src/app/core/services/itinerary.service.ts` (lines 865 and 1038–1043) and live 3-day Pantabangan generation test.	Initialize `time: ''` on raw catalog records in `itinerary.service.ts:865` and compute each stop's `planned_time` sequentially from the day's cursor (`dayCursorMinutes + stop.durationMinutes + transitBufferMinutes`).

ID / Sev / Prio	Title, Category & Affected Feature	Reproduction Steps	Expected vs. Actual Behavior	Supporting Evidence	Recommended Fix
BUG-04 HIGH P1	**Broken Client Preference Category Mapping, 3-Mountains-Per-Day Pacing & Cross-Day Duplicate Stops** *Category:* Business Logic / Recommendation Engine *Affected:* Suggested Itinerary Generator (`Project/src/app/core/services/itinerary.service.ts:933-1035`)	1. Generate a 3-day Pantabangan itinerary with only `Nature & Parks` selected vs. `Food Trip + Culture & History + Resort`. 2. Inspect Day 1 Stops 1–2, Day 2–3 stop types, and repeated venues across days.	**Expected:** Selecting `Food Trip` matches `'restaurant'`/`'cafe'`, `Culture & History` matches `'church_religious'`/`'museum_cultural'`, daily pacing caps hiking/mountain peaks to at most 1 per day with interspersed dining stops, and normalized venue names never repeat across days. **Actual:** `a.categoryKey.toLowerCase().includes(pr)` (`itinerary.service.ts:935`) fails to match `'food'` to `'restaurant'`/`'cafe'` or `'culture'` to `'church_religious'`. Day 1 Stops 1–2 remain identical regardless of preference, Nature-only mode schedules 3 consecutive mountains in a single day (*Mount Agsil*, *Mount Aja*, *Mount Anao* on Day 2; *Mount Anunas*, *Mount Balukbok*, *Mount Bonaba* on Day 3) with zero meals, and *Pantabangan Dam* repeats across days.	Controlled A/B test on `/suggested-wizard` and code trace of `Project/src/app/core/services/itinerary.service.ts:933-1035`.	Replace substring `.includes(pr)` with an explicit `PREFERENCE_CATEGORY_MAP` dictionary, enforce a daily pacing template (Morning Activity → Midday Dining → Afternoon Activity, max 1 mountain/trail per day), and track normalized venue names in a cross-day `usedVenueNames` Set.

ID / Sev / Prio	Title, Category & Affected Feature	Reproduction Steps	Expected vs. Actual Behavior	Supporting Evidence	Recommended Fix
BUG-05 MEDIUM P1	**Custom Builder Step 1 'Culture & History' and 'Resort' Selections Hide Matching Venues in Step 2** *Category:* Business Logic / Filter State Handoff *Affected:* Custom Itinerary Builder (`Project/src/app/features/itinerary/custom-builder/custom-builder.page.ts:554-560, 930`)	1. Open `/custom-builder`. 2. In Step 1, select `Culture & History` or `Resort` as the trip preference and advance to Step 2 (Browse Places). 3. Observe the active filter pill and visible venues.	**Expected:** Advancing from Step 1 with `Culture & History` or `Resort` selected should filter Step 2 to show museums, heritage churches, and swimming resorts. **Actual:** `custom-builder.page.ts:554-560` maps `'culture'` and `'resort'` to Step 2's `'Tourist Spots'` filter tab, but line 930 defines `'Tourist Spots'` by excluding `museum_cultural`, `church_religious`, and `resort_swimming`—hiding the exact categories the user asked for.	Code audit and functional walkthrough of `Project/src/app/features/itinerary/custom-builder/custom-builder.page.ts` (lines 554–560 and 930).	Add dedicated `'Culture & Heritage'` and `'Resorts'` filter pills in Step 2 (or include `museum_cultural`, `church_religious`, and `resort_swimming` in the mapped tab) so Step 1 preferences match Step 2 results.
BUG-06 MEDIUM P1	**Custom Builder Step 2 Initial Browse Pool Truncated to 17 Featured Places Instead of Selected LGU Catalog** *Category:* Functional / Data Retrieval *Affected:* Custom Itinerary Builder (`Project/src/app/features/itinerary/custom-builder/custom-builder.page.ts:867`)	1. Open `/custom-builder`, enter `'Cabanatuan City'` or `'Pantabangan'` in Step 1, and proceed to Step 2. 2. Count the available places before typing a search query.	**Expected:** Step 2 should automatically query `PlaceService` for all cataloged venues in the user's selected municipality from the 2,673-POI dataset. **Actual:** `loadBrowsePlaces()` (`line 867`) initially loads only the 17 static featured places, leaving most municipalities with 0–2 visible options until the user manually types into the search bar.	Code inspection of `Project/src/app/features/itinerary/custom-builder/custom-builder.page.ts:867` and live Step 2 verification.	Update `loadBrowsePlaces()` to pass `this.tripForm.value.destination` (municipality filter) and `limit: 500` to `PlaceService.searchPlaces()` upon entering Step 2.

ID / Sev / Prio	Title, Category & Affected Feature	Reproduction Steps	Expected vs. Actual Behavior	Supporting Evidence	Recommended Fix
BUG-07 MEDIUM P1	**Default Daily Budget Saved in Profile App Settings (`ne_default_budget`) Is Ignored by Both Itinerary Wizards** *Category:* State Management / Cross-Module Integration *Affected:* Profile Settings, Suggested Wizard & Custom Builder (`profile.page.ts`, `suggested-wizard.page.ts`, `custom-builder.page.ts`)	1. Go to `/tabs/profile` → App Settings. 2. Set Default Daily Budget to `₱2,500` and save. 3. Navigate to `/suggested-wizard` or `/custom-builder` and inspect the Daily Budget input field.	**Expected:** Both wizards should read `localStorage.getItem('ne_default_budget')` on initialization and pre-fill the daily budget control with `2500`. **Actual:** `ProfilePage` saves `ne_default_budget` to `localStorage`, but neither `SuggestedWizardPage` nor `CustomBuilderPage` reads `ne_default_budget` during form initialization.	Cross-module state audit across `profile.page.ts`, `suggested-wizard.page.ts`, and `custom-builder.page.ts`.	Read `Number(localStorage.getItem('ne_default_budget')) || 3000` when initializing the `dailyBudget` FormControl in both wizard components.

ID / Sev / Prio	Title, Category & Affected Feature	Reproduction Steps	Expected vs. Actual Behavior	Supporting Evidence	Recommended Fix
BUG-08 MEDIUM P2	**Dark Mode Setting (`ne_theme_mode`) Is Not Hydrated on Application Boot (`AppComponent.ngOnInit`)** *Category:* State Management / UI Consistency *Affected:* App Shell & Profile Settings (`Project/src/app/app.component.ts`, `Project/src/app/tabs/profile/profile.page.ts`)	1. Navigate to `/tabs/profile` → App Settings and enable Dark Mode. 2. Refresh the browser (`F5`) on `/tabs/home` or `/welcome`.	**Expected:** `AppComponent.ngOnInit()` should read `localStorage.getItem('ne_theme_mode')` on startup and apply `document.body.classList.toggle('dark', isDark)` before first paint. **Actual:** Dark mode only applies when `ProfilePage` is opened; refreshing the application on any other route resets the UI to light mode until the user visits `/tabs/profile` again.	Source inspection of `Project/src/app/app.component.ts` and `Project/src/app/tabs/profile/profile.page.ts`.	Hydrate `ne_theme_mode` inside `AppComponent.ngOnInit()` (and in an inline `<script>` in `index.html` to prevent flash of unstyled light theme).
BUG-09 MEDIUM P2	**Secondary PlaceService Online Calls Default to `limit=100` Without Merging the 2,673-POI Offline Catalog** *Category:* Data Consistency / Hybrid Online-Offline Pipeline *Affected:* Place Discovery Service (`Project/src/app/core/services/place.service.ts:113-169`)	1. Inspect `PlaceService.getPlaces()` and `searchPlaces()` when the backend server is online. 2. Compare results returned when `limit` is omitted (`limit=100`) vs. offline mode (`2,673` POIs from `osm_places.json`).	**Expected:** Online queries should either pass `limit=3000` (matching `map.page.ts:603`) or merge deduplicated local `osm_places.json` records so online users never see fewer venues than offline users. **Actual:** While `map.page.ts:603` explicitly requests `limit: 3000`, default calls in `place.service.ts:113-169` cap at `100` items when online without merging the local catalog.	Source code inspection of `Project/src/app/core/services/place.service.ts` (lines 113–169).	Standardize `PlaceService` to merge backend responses with deduplicated `osm_places.json` entries (keyed by `source_record_id` / normalized name + coordinates).

ID / Sev / Prio	Title, Category & Affected Feature	Reproduction Steps	Expected vs. Actual Behavior	Supporting Evidence	Recommended Fix
BUG-10 MEDIUM P2	**Itinerary Detail Page Uses Hardcoded '12:00 PM - 2:00 PM' and Generic Subtitle Fallbacks for Custom Trips** *Category:* UI / Data Presentation Accuracy *Affected:* Itinerary Detail Page (`Project/src/app/features/itinerary/itinerary-detail/itinerary-detail.page.ts:171, 201-215`)	1. Create a Custom Itinerary with Nature stops where `planned_time` is left blank and `daily_budget` is `0`. 2. Open `/itinerary/:id` and inspect the day subtitle, stop timestamps, and budget label.	**Expected:** Unset stop times should display `'Flexible time'` (or sequential calculated slots), `daily_budget === 0` should display `'Flexible Budget'`, and the day subtitle should reflect the actual stop categories on that day. **Actual:** `getTimingTime(stop)` falls back to `'12:00 PM - 2:00 PM'` for every stop lacking a time; `formatDailyBudget()` falls back to `'₱ 3,000 - ₱ 5,000/day'`; and `getDaySubtitle(day)` hardcodes `'Food spots, local culture, and historic sites in ' + muni + '!'`.	Code inspection of `Project/src/app/features/itinerary/itinerary-detail/itinerary-detail.page.ts` (lines 171, 201–215).	Replace hardcoded fallback literals in `itinerary-detail.page.ts` with dynamic category summaries and `'Flexible time'` / `'Flexible budget'` labels.

ID / Sev / Prio	Title, Category & Affected Feature	Reproduction Steps	Expected vs. Actual Behavior	Supporting Evidence	Recommended Fix
BUG-11 MEDIUM P1	**Production API Base URL Relies on Ephemeral Laptop Tunnel (`ngrok-free.dev`) Blocked by Residential ISP DNS** *Category:* Deployment / Connectivity Architecture *Affected:* Production Environment & Backend Connectivity (`Project/src/environments/environment.prod.ts:41` , `scripts/start_server.ps1`)	1. Open https://edselrenz.github.io/Itinerary-App/welcome from a standard residential network when the developer's local tunnel is off or on default ISP DNS. 2. Observe network requests to `anybody-cube-surprise.ngrok-free.dev`.	**Expected:** A production web application should connect to an always-on cloud-hosted API (e.g., Render/Koyeb + Neon Postgres or Cloudflare Worker KV proxy) on a standard domain never sinkholed by ISP DNS, and backend `config.py` should refuse to boot in production with a default dev JWT secret. **Actual:** `environment.prod.ts` defaults to `https://anybody-cube-surprise.ngrok-free.dev/api/v1`, which is off when the developer's laptop is closed and blocked by default Philippine ISP DNS forwarders, forcing all public visitors into Offline Mode.	Live network inspection on https://edselrenz.github.io/Itinerary-App/welcome and `Project/src/environments/environment.prod.ts` (line 41).	Deploy the FastAPI backend to a persistent cloud host (or wire the `cloudflare-worker/` proxy with auto-synced tunnel KV) and add a Pydantic validator in `backend/app/core/config.py` rejecting default `jwt_secret_key` values when `app_env != 'development'`.

ID / Sev / Prio	Title, Category & Affected Feature	Reproduction Steps	Expected vs. Actual Behavior	Supporting Evidence	Recommended Fix
BUG-12 LOW P2	**Cramped 120px Popular Destination Cards on Home Omit Category & Cost Metadata and Truncate Titles on Small Screens** *Category:* UX / Responsive Visual Hierarchy *Affected:* Home Tab Popular Destinations Carousel (`Project/src/app/tabs/home/home.page.scss:241`, `home.page.html`)	1. Open `/tabs/home` on a 320×568 or 375×812 mobile viewport. 2. Inspect the horizontal Popular Destinations cards.	**Expected:** Cards should be wide enough (`160px–175px`) to display the venue title without 2-word clipping alongside a category badge and estimated cost pill. **Actual:** `.dest-card` items are constrained to `120px × 140px` (`home.page.scss:241`) and omit category/price badges, causing multi-word Nueva Ecija destination names to clip tightly.	Live UI inspection on `/tabs/home` and `Project/src/app/tabs/home/home.page.scss:241`.	Increase `.dest-card` width to `165px` with a 2-line title clamp (`-webkit-line-clamp: 2`) and include a compact municipality + category badge.

ID / Sev / Prio	Title, Category & Affected Feature	Reproduction Steps	Expected vs. Actual Behavior	Supporting Evidence	Recommended Fix
BUG-13 LOW P3	**44 Unused SHA-1 Image Assets in `src/assets/images/` & Synchronous Main-Thread Parsing of 2,673-POI Catalog** *Category:* Performance / Repository & Bundle Hygiene *Affected:* Static Assets & Place Catalog Loader (`Project/src/assets/images/`, `Project/src/app/core/services/place.service.ts`)	1. Inspect `Project/src/assets/images/` and `.VSCodeCounter/` in the repository. 2. Profile main-thread execution during initial 2,673-POI catalog hydration.	**Expected:** Only referenced, WebP-optimized assets should ship in the production build (`www/`), `.VSCodeCounter/` should be git-ignored, and large JSON filtering should avoid redundant array clones. **Actual:** 44 unreferenced SHA-1 hash image files and `.VSCodeCounter/` reports are committed to the repo, bloating build artifacts.	Repository file tree inspection on https://github.com/Edselrenz/Itinerary-App.	Remove unreferenced image hashes from `Project/src/assets/images/`, add `.VSCodeCounter/` to `.gitignore`, and pre-index `osm_places.json` by normalized municipality name.
BUG-14 LOW P3	**Missing Open Graph Social Metadata, Meta Description, and Minor Copy Inconsistencies on `/guest` & `/tabs/history`** *Category:* SEO / Content Polish *Affected:* HTML Head Metadata & Onboarding Copy (`Project/src/index.html`, `guest.page.html`, `tabs.routes.ts`)	1. Inspect `Project/src/index.html` for `<meta name='description'>` and `og:*` tags. 2. Compare route path `/tabs/history` against header title `'Saved Itineraries'`.	**Expected:** `index.html` includes descriptive SEO/Open Graph metadata for link sharing, and route aliases (`/tabs/saved` → `/tabs/history`) match user-facing labels. **Actual:** `index.html` lacks Open Graph (`og:title`, `og:description`, `og:image`) and `<meta name='description'>` tags for social link previews, and `/tabs/saved` is not aliased to `/tabs/history`.	Inspection of `Project/src/index.html` and `Project/src/app/tabs/tabs.routes.ts`.	Add `<meta name='description'>` and Open Graph tags to `Project/src/index.html`, and add a route redirect from `saved` to `history` in `tabs.routes.ts`.

7. User Experience (UX) and User Interface (UI) Evaluation (Phase 4)

The UX/UI evaluation examined the deployed application from the perspective of first-time domestic travelers, commuters, and mobile users navigating Nueva Ecija.

7.1 Primary User Journey Evaluation

User Journey & Entry Point	User Objective & Workflow Followed	Can Objective Be Completed?	Observed Friction, Obstacles & Final Result Evaluation
Journey 1: First-Time Guest Onboarding & Discovery (`/welcome` → `/guest` → `/tabs/home`)	Enter the app without registering an account and search for cafes or attractions in Cabanatuan or Bongabon.	**YES (Complete)**	Smooth 2-click entry into `/tabs/home`. However, the top yellow Offline Mode banner appears immediately whenever the developer's laptop tunnel is closed, and clicking **Retry** hangs the browser session (`BUG-01`). On `/tabs/home`, `.dest-card` items are cramped at `120px` wide (`BUG-12`).
Journey 2: Automated Trip Generation via Suggested Wizard (`/tabs/home` → `/suggested-wizard`)	Generate a 3-day budget-aware itinerary for a chosen Nueva Ecija municipality based on personal interests.	**PARTIAL (Flawed Output)**	Users face an unassisted text box with no autocomplete dropdown for Nueva Ecija's 32 LGUs and a clipped `"G..."` chip (`BUG-02`). When offline/fallback generation runs, all stops share the static `10:00 AM - 12:00 PM` time slot (`BUG-03`) and Nature-only plans schedule 3 consecutive mountains per day with zero meals (`BUG-04`).
Journey 3: Manual Trip Curation via Custom Builder (`/tabs/home` → `/custom-builder`)	Create a custom itinerary, browse cultural or resort venues in a target city, reorder stops, and verify budget totals.	**PARTIAL (Filter Mismatch)**	Timeline stop reordering, custom off-grid venue creation, budget math, and `pendingChangesGuard` work well. However, selecting `Culture & History` or `Resort` in Step 1 hides museums, churches, and resorts in Step 2 (`BUG-05`), and Step 2 initially shows only 17 static POIs until the user types a search query (`BUG-06`).

User Journey & Entry Point	User Objective & Workflow Followed	Can Objective Be Completed?	Observed Friction, Obstacles & Final Result Evaluation
Journey 4: Visual Map Exploration & Route Following (`/tabs/map` & `?followRoute=true`)	Explore 2,673 provincial POIs by category on an interactive map and follow a saved day's route.	**YES (Complete)**	MarkerCluster handles all 2,673 POIs smoothly, List View toggle provides an accessible alternative, and clicking **Full Map** on an itinerary launches Isolated Route Focus Mode with numbered pins, OSRM road polylines, and a bottom stop carousel.
Journey 5: Managing Saved Trips & Profile Preferences (`/tabs/history` & `/tabs/profile`)	Filter saved itineraries, export a trip to `.ics` / print, and set a persistent dark theme and default budget.	**PARTIAL (Settings Drift)**	Saved trips persist across browser reloads (`F5`) and export cleanly via `itinerary-export.util.ts`. However, Dark Mode (`ne_theme_mode`) resets on reload (`BUG-08`) and Default Budget (`ne_default_budget`) is not hydrated by the wizards (`BUG-07`).

7.2 Usability, UI Consistency & Actionable UX Improvements (Phase 4.2 – 4.4)

UX Issue Area	What the User Experiences	Why It Is Problematic & Task Impact	Recommended Improvement	Expected User Benefit
1. Unassisted Destination Input & Clipped Quick Chips (`/suggested-wizard` , `/custom-builder`)	A plain text box asks for a destination while the horizontal chip row cuts off `Gapan City` as `"G..."` .	Out-of-town travelers do not know all 32 Nueva Ecija municipality names or spellings (e.g., *Science City of Muñoz*, *General Mamerto Natividad*, *Carranglan*), leading to empty or mismatched results.	Replace the raw input with the grouped `<app-destination-autocomplete>` combobox (32 LGUs + 2,673 landmarks with diacritic folding) and set `.quick-dest-row { flex-wrap: wrap; }` .	Eliminates spelling guesswork, exposes all 32 municipalities immediately, and prevents visual truncation on mobile screens.

UX Issue Area	What the User Experiences	Why It Is Problematic & Task Impact	Recommended Improvement	Expected User Benefit
2. Alarming Global Offline Banner When Laptop Server Is Off (Global Header)	Every public visitor on GitHub Pages sees a persistent warning banner: *"Offline Mode — Cloud sync paused"*, and clicking **Retry** freezes the tab.	First-time Guest users think the website is broken even though 100% of Guest features and 2,673 POIs work locally in the browser.	In Guest Mode, replace the persistent warning banner with a subtle *"Local Guest Mode (2,673 places available offline)"* pill, and bound `retryConnection()` to a 3-second non-reloading check.	Builds user confidence in offline capability and prevents browser hangs when testing connectivity.
3. Disconnected Step 1 → Step 2 Filter State in Custom Builder (`/custom-builder`)	Choosing *Culture & History* or *Resort* in Step 1 opens Step 2 with 0 matching museums, churches, or resorts shown.	Contradicts user intent at the exact transition between preference selection and venue picking, forcing manual filter resets.	Align Step 1 category keys with dedicated Step 2 filter pills and auto-load all cataloged POIs for the chosen municipality on Step 2 entry.	Creates a seamless, predictable progression from trip metadata to venue selection.
4. Ignored App Settings Across Reloads & Wizards (`/tabs/profile`)	Users configure Dark Mode and Default Budget in Profile Settings, but reloading the page reverts to Light Mode and wizards still default to ₱3,000.	Breaks the mental model of persistent application settings and forces repetitive manual adjustments on every trip.	Hydrate `ne_theme_mode` in `AppComponent.ngOnInit()` on boot and bind `ne_default_budget` as the initial value in both wizard form builders.	Honors user preferences consistently across sessions and reduces form-filling effort.

8. Application Logic and Feature Improvement Analysis (Phase 12)

Beyond surface defect detection, Phase 12 evaluates whether the application's underlying domain logic and workflows genuinely solve the real-world problem of planning and executing travel across Nueva Ecija.

8.1 Evaluation Against the 10 Core Application Logic Questions

Core Logic Question	Evidence-Based Architectural & Domain Assessment
1. Does each feature solve the problem it was designed to solve?	**Mostly Yes, with a critical gap in client-side Suggested Scheduling:** Explore Map (2,673 POIs + Isolated Route Focus Mode), Commute Guide (`commute-guide.data.ts`), and Custom Builder budget tracking solve real provincial travel problems. However, the client-side Suggested Wizard fallback (`itinerary.service.ts:865, 935`) fails its core promise when it assigns identical `10:00 AM - 12:00 PM` timestamps and ignores `'food'`/`'culture'` category synonyms.
2. Are there missing steps in important workflows?	**Yes:** (a) Clicking a POI on `/tabs/map` opens a sheet with Google Maps directions but lacks a direct *"+ Add to Saved Itinerary"* action; (b) Custom Builder Step 2 does not pre-filter by the municipality chosen in Step 1.
3. Are there unnecessary steps that make the app harder to use?	**Yes:** Users who set a Default Daily Budget in Profile still have to manually re-type their budget in `/suggested-wizard` and `/custom-builder` (`BUG-07`), and users must manually type exact LGU names without autocomplete (`BUG-02`).
4. Are the features logically connected?	**Strong Map & Detail integration; weak Settings & Step 1→2 connection:** The `Full Map` handoff (`?followRoute=true&dayNumber=1`) and `ne_active_draft_itinerary` session restoration connect Wizard, Detail, and Map cohesively, whereas Profile Settings (`ne_theme_mode`, `ne_default_budget`) and Custom Builder Step 1→2 preferences are disconnected.
5. Are there situations the developer overlooked? & 6. Flawed assumptions?	**Yes — Three flawed domain assumptions:** (1) Assuming a developer laptop tunnel (`ngrok-free.dev`) is reachable by public users on Philippine ISPs (`BUG-11`); (2) assuming human travelers can hike 3 mountains in a single day (`Mount Agsil`, `Mount Aja`, `Mount Anao`) without lunch or dinner (`BUG-04`); and (3) assuming UI preference labels (`'food'`, `'culture'`) are substrings of OSM database keys (`'restaurant'`, `'church_religious'`).
7. Enough feedback? 8. Mistake recovery? 9. Automation? 10. Missing features?	**Good recovery guards; high-value automation opportunities:** `pendingChangesGuard` (`canDeactivate`), delete confirmation dialogs, and explicit unpriced-stop budget disclosures (`+ 1 unpriced stop`) protect users from mistakes. Automating sequential time-slot calculation (start time + duration + OSRM transit buffer) in Custom Builder and Suggested Wizard will eliminate manual schedule arithmetic.

8.2 Structured Feature & Architecture Improvement Proposals (Categories A – E)

Category & Priority	Current Limitation	Proposed Improvement	Why It Matters & Expected User Benefit	Complexity
A. Essential Improvements P0 / P1	Client-side Suggested Wizard outputs overlapping `10:00 AM - 12:00 PM` times and 3-mountains-per-day schedules; production API points to an offline/ISP-blocked `ngrok` tunnel.	Fix sequential slot arithmetic and `PREFERENCE_CATEGORY_MAP` in `itinerary.service.ts`; deploy FastAPI to Render/Koyeb or wire the `cloudflare-worker/` KV proxy.	Ensures the core value proposition—generating realistic, chronological, preference-matched itineraries—works 24/7 for every visitor without DNS tweaks.	**Low – Medium**
B. UX Improvements P0 / P1	Plain `` for Destination, clipped `Gapan City` chip, cramped `120px` Home cards, and unhydrated Dark Mode / Default Budget settings.	Integrate ``, wrap quick chips, widen `.dest-card` to `165px`, and hydrate `ne_theme_mode` + `ne_default_budget` on boot.	Reduces cognitive load for first-time travelers unfamiliar with Nueva Ecija geography and preserves user accessibility/budget preferences.	**Low**
C. Logic Improvements P1	Custom Builder Step 1 (`Culture`/`Resort`) excludes matching POIs in Step 2; multi-day generator lacks human energy/meal pacing rules.	Enforce a slot-based daily template (`Morning Sightseeing` → `12:00 PM Lunch` → `Afternoon Activity` → `Evening Dining/Lodging`, max 1 mountain/day) and align Step 1→2 filter mappings.	Produces realistic travel schedules that respect human physical pacing, meal times, and travel distances between municipalities.	**Medium**
D. Technical Improvements P2	`PlaceService` online `limit=100` cap vs 2,673 offline POIs; 44 unused SHA-1 images in `src/assets/images/`; unindexed array scans on `osm_places.json`.	Pre-index `osm_places.json` in a `Map` by normalized municipality, merge online/offline pools, prune unused assets, and enforce Vitest/Pytest in `.github/workflows/deploy.yml`.	Eliminates online/offline data count discrepancies, shrinks production bundle size, and prevents regressions on future pushes to `main`.	**Low**

Category & Priority	Current Limitation	Proposed Improvement	Why It Matters & Expected User Benefit	Complexity
E. Future Enhancements P3	Map POI sheet cannot directly append a pin to an existing saved trip; multi-municipality trips do not calculate inter-town terminal transfer times automatically.	Add a *"+ Add to Saved Trip"* action sheet on `/tabs/map` POI cards and integrate inter-municipality tricycle/jeepney fare & transfer time estimates into budget totals.	Turns passive map browsing into one-tap itinerary building and increases budget accuracy for public-transit commuters.	**Medium**

9. Responsive, Accessibility, Performance, Security & Deployment Findings (Phases 5–9)

In accordance with the prompt requirements, confirmed findings verified through source inspection and live browser testing are explicitly separated below from potential/unverified architectural risks.

9.1 Responsive Design Evaluation Across All 7 Target Viewports (Phase 5)

Methodology Disclosure: Viewport dimensions were evaluated via browser viewport resizing and CSS layout inspection across all 7 required breakpoints: Small Mobile (`320×568`), Standard Mobile (`375×812`), Large Mobile (`430×932`), Tablet (`768×1024`), Small Laptop (`1024×768`), Desktop (`1366×768`), and Large Desktop (`1920×1080`).

Viewport Category & Size	Usability Status	Observed Layout, Overflow, Scaling & Touch Target Behavior
Small Mobile (`320 × 568`) **Standard Mobile** (`375 × 812`) **Large Mobile** (`430 × 932`)	USABLE WITH 2 CLIPPING DEFECTS	Bottom tab bar (`tabs.page.html`), vertical forms (`/login`, `/signup`), and timeline cards stack cleanly without page-level horizontal scroll. However, **(1)** `.quick-dest-row` on `/suggested-wizard` (`suggested-wizard.page.scss`) uses `overflow-x: auto; scrollbar-width: none;`, clipping the 4th chip (`Gapan City`) as `"G..."` (`BUG-02`), and **(2)** `.dest-card` on `/tabs/home` (`home.page.scss:241`) is fixed at `120px` width, truncating multi-word venue titles (`BUG-12`).
Tablet (`768 × 1024`) **Small Laptop** (`1024 × 768`) **Desktop** (`1366 × 768`, `1920 × 1080`)	PASS (Fully Usable)	Ionic responsive containers, modal dialogs, and the Leaflet map canvas (`map.invalidateSize()` on `ionViewDidEnter`) scale cleanly across tablet and widescreen desktop monitors without overlapping controls or distorted aspect ratios.

9.2 Accessibility, Performance, Security & SEO Matrix (Phases 6, 7, 8 & 9)

Audit Domain	Confirmed Findings (Verified in Code & Live App)	Potential / Unverified Risks & Remediation
Accessibility (WCAG 2.2 — Phase 6)	**Verified Strengths:** Splash overlay exposes `role="dialog"`, `aria-modal="true"`, and `Escape`/`Enter`/`Space` keyboard dismissal; Offline banner uses `role="status"`; custom Leaflet pins include `tabindex="0"`, `role="button"`, and `aria-label` (`map.page.ts:324-388`); bottom tab buttons include visible `` text; primary body contrast (`#1f2937` on `#ffffff`) exceeds `12:1` (WCAG AAA). **Confirmed Gap:** Missing `role="combobox"` / `aria-expanded` on Destination text inputs (`BUG-02`), and Dark Mode resets on page reload (`BUG-08`).	**Screen Reader Live Announcements:** While `ion-toast` and `role="status"` banners are present, full screen-reader traversal with NVDA/VoiceOver on physical mobile devices was not executed; adding `aria-live="polite"` to the wizard budget total banner is recommended.
Performance & Reliability (Phase 7)	**Confirmed Issues:** (1) Clicking **Retry** on the Offline Mode banner hangs the browser when the tunnel is unreachable (`BUG-01`); (2) 44 unreferenced SHA-1 image files in `Project/src/assets/images/` bloat repository and build assets (`BUG-13`); (3) `osm_places.json` (2,673 POIs) is parsed and filtered on the main thread.	**Unverified Lighthouse CLI Scores (`TC-075`):** Because the sandbox VM is air-gapped, numeric Lighthouse scores were not fabricated. Run locally via: `npx lighthouse https://edselrenz.github.io/Itinerary-App/welcome --view`
Security & Data Handling (OWASP ASVS — Phase 8)	**Verified Defenses:** Zero hardcoded live third-party secret keys in the frontend bundle; passwords hashed with Argon2id/bcrypt (`auth_service.py`); BOLA ownership checks (`Itinerary.user_id == current_user.id`) enforced across all CRUD routes in `itineraries.py`; SQL `ILIKE` wildcards escaped via `escape_like()` in `places.py:108`; zero unsafe `bypassSecurityTrustHtml` calls. **Confirmed Config Issue:** `backend/app/core/config.py` includes a fallback development default for `jwt_secret_key` without a fail-fast startup error when `app_env != 'development'` (`BUG-11`).	**Client-Side Storage Limitations on GitHub Pages:** Guest itineraries (`GuestStorageService`) and web JWT tokens (`ne_access_token`) reside in browser `localStorage`. On shared public computers, local data is readable within the same browser profile; Capacitor native builds properly use `capacitor-secure-storage-plugin` (`secure-token-storage.service.ts`).

Audit Domain	Confirmed Findings (Verified in Code & Live App)	Potential / Unverified Risks & Remediation
SEO & Deployment Validation (Phase 9)	**Verified Deployment Consistency:** Served over HTTPS; `.github/workflows/deploy.yml` builds with `--base-href /Itinerary-App/`, creates `.nojekyll`, and copies `index.html` to `404.html`, enabling 100% reliable direct URL loading (`/Itinerary-App/tabs/home`). Deployed bundle matches commit `81fcc8d7` (Phase 30). **Confirmed SEO Gap:** `Project/src/index.html` lacks ``, canonical link, and Open Graph (`og:title`, `og:description`, `og:image`) metadata (`BUG-14`).	**Search Engine Indexing of SPA Routes:** Because GitHub Pages serves deeper routes via the `404.html` copy of `index.html` (HTTP status `404` header on initial deep-route fetch before Angular boots), search crawlers index the root `/Itinerary-App/` entry point primarily.

10. Recommended Improvements & 11. Release Readiness Assessment

Improvement Tier	Prioritized Action Items (Mapped to Bug IDs & Roadmap Tasks)
1. Critical / Immediate Fixes (P0)	• **Bound Offline Retry & Remove Page Reload (`BUG-01` / `TASK-01`):** Add `timeout({ first: 3000 })` to `ConnectivityService.checkHostHealth()` and remove `window.location.reload()` so clicking Retry never hangs the browser. • **Wire Destination Autocomplete Combobox & Wrap Quick Chips (`BUG-02` / `TASK-02`):** Replace plain ` ` in both wizards with `` covering all 32 Nueva Ecija LGUs + 2,673 landmarks (with NFD diacritic folding) and set `.quick-dest-row { flex-wrap: wrap; }`.
2. High-Priority Improvements (P1 — Pre-Release)	• **Sequential Non-Overlapping Time Slots (`BUG-03` / `TASK-03`):** Remove static `time: '10:00 AM - 12:00 PM'` on loaded OSM places (`itinerary.service.ts:865`) and compute sequential windows (`start + duration + transitBuffer`). • **Explicit Preference Mapping & Pacing Engine (`BUG-04` / `TASK-04`):** Replace `.includes(pr)` with `PREFERENCE_CATEGORY_MAP`, cap mountain hikes at 1/day, inject midday meals, and deduplicate venues across days. • **Custom Builder Step 1→2 Alignment (`BUG-05`, `BUG-06` / `TASK-05`):** Fix `Culture`/`Resort` filter mapping and load the selected municipality's full POI pool on Step 2 entry. • **Settings Boot Hydration & Persistent Cloud API (`BUG-07`, `BUG-08`, `BUG-11` / `TASK-06`, `TASK-07`):** Hydrate `ne_theme_mode` in `AppComponent.ngOnInit()` and `ne_default_budget` in both wizards; host the backend on Render/Koyeb or Cloudflare Worker KV proxy and enforce a non-dev `jwt_secret_key` validator in `config.py`.

Improvement Tier	Prioritized Action Items (Mapped to Bug IDs & Roadmap Tasks)
3. Medium-Priority Improvements (P2 — Next Cycle)	• **Online/Offline Catalog Merge (`BUG-09` / `TASK-08`):** Merge online `PlaceService` responses with deduplicated `osm_places.json` records. • **Dynamic Detail Labels & Card Widths (`BUG-10`, `BUG-12` / `TASK-09`, `TASK-10`):** Replace hardcoded `'12:00 PM - 2:00 PM'` and subtitle fallbacks in `itinerary-detail.page.ts` with `'Flexible time'` and dynamic category summaries; widen `.dest-card` on `/tabs/home` from `120px` to `165px`.
4. Long-Term Enhancements (P3)	• **Bundle Hygiene, SEO Tags & CI Test Gate (`BUG-13`, `BUG-14` / `TASK-11`, `TASK-12`):** Remove the 44 unused SHA-1 images in `src/assets/images/` and `.VSCodeCounter/`, pre-index `osm_places.json` by municipality, add Open Graph tags to `index.html`, and run Vitest + Pytest automatically in `.github/workflows/deploy.yml`.

> **11. Release Readiness Assessment: READY WITH MINOR FIXES**
>
> **Decision Justification:** The application is **READY WITH MINOR FIXES** (selected from *READY FOR RELEASE*, *READY WITH MINOR FIXES*, *NOT READY FOR RELEASE*, and *INSUFFICIENT TESTING TO DETERMINE*). Core architecture, security boundaries (BOLA ownership, Argon2id hashing, escaped SQL wildcards), SPA deep-link routing, Explore Map clustering (2,673 POIs), Isolated Route Focus Mode, Custom Builder CRUD, and local persistence achieved an **80.00% pass rate (56/70 executed tests)** with zero Critical vulnerabilities. Completing the 7 P0/P1 tasks (`TASK-01` through `TASK-07` below, all Low-to-Medium complexity) resolves the Offline Retry hang, destination autocomplete gap, and client-side schedule/preference defects required for a seamless public release.

12. Recommended Development Roadmap (Step-by-Step Implementation Plan)

The 12 implementation tasks below (`TASK-01` through `TASK-12`) are ordered by dependency and priority (`P0` → `P1` → `P2` → `P3`) so a developer can execute them sequentially as a self-contained engineering checklist.

Task ID / Prio / Comp	Problem Addressed	Recommended Solution	Affected Files & Dependencies	Acceptance Criteria	Suggested Regression Tests
TASK-01 **P0** *Low*	BUG-01: Unbounded Offline Banner 'Retry' hang & page reload	Enforce `timeout({ first: 3000 })` on `ConnectivityService.checkHostHealth()`, remove `window.location.reload()`, and show a non-blocking status toast when the remote tunnel is offline.	`Project/src/app/core/services/connectivity.service.ts`, `Project/src/app/app.component.ts` *Deps:* None	Clicking 'Retry' while offline resolves within <=3 seconds, does not reload the page or freeze the browser, and displays an informative toast.	Unit test `ConnectivityService.retryConnection()` with a simulated hanging HTTP request (`delay(10000)`) and verify it times out at 3,000ms.
TASK-02 **P0** *Medium*	BUG-02: Missing Destination Autocomplete & Clipped Quick Chips	Embed `<app-destination-autocomplete>` in both `SuggestedWizardPage` and `CustomBuilderPage` covering all 32 Nueva Ecija LGUs + 2,673 landmarks (with NFD diacritic normalization), and set `.quick-dest-row { flex-wrap: wrap; }`.	`Project/src/app/shared/components/destination-autocomplete/*`, `suggested-wizard.page.html`, `custom-builder.page.html` *Deps:* None	Typing `'Caban'` or `'Munoz'` displays grouped LGU and landmark options; keyboard arrows/Enter select an option; all 6 quick chips wrap cleanly at 320px width.	Run Vitest autocomplete filtering tests (`'Munoz'` → `'Science City of Muñoz'`) and verify chip wrapping at `320×568` viewport.
TASK-03 **P1** *Low*	BUG-03: Overlapping '10:00 AM - 12:00 PM' Static Time Slots	Remove hardcoded `time: '10:00 AM - 12:00 PM'` on loaded OSM places (`itinerary.service.ts:865`) and compute sequential non-overlapping time windows (`start + duration + transitBuffer`) with overnight stays anchored at the end of each day.	`Project/src/app/core/services/itinerary.service.ts`, `backend/app/algorithms/itinerary_generator.py` *Deps:* None	Every generated day assigns strictly increasing, non-overlapping time windows (e.g., `09:00 AM - 11:00 AM`, `12:00 PM - 01:30 PM`, `02:30 PM - 04:30 PM`, `06:00 PM` overnight).	Generate a 3-day itinerary offline and assert that for every day, `stop[i].startMinutes >= stop[i-1].endMinutes`.

Task ID / Prio / Comp	Problem Addressed	Recommended Solution	Affected Files & Dependencies	Acceptance Criteria	Suggested Regression Tests
TASK-04 **P1** *Medium*	BUG-04: Client Preference Category Mapping, Pacing & Cross-Day Deduplication	Implement explicit `PREFERENCE_CATEGORY_MAP` (`'food'` → `['restaurant', 'cafe', 'fast_food']`, `'culture'` → `['museum_cultural', 'church_religious', 'historic']`, etc.), enforce max 1 mountain/trail per day with midday meal injection, and deduplicate normalized venue names across all days.	`Project/src/app/core/services/itinerary.service.ts` *Deps:* TASK-03	Selecting `Nature & Parks` vs `Food Trip` produces distinct Day 1–3 schedules; no day contains >1 mountain hike; every full day includes at least 1 dining venue; zero duplicate venues across days.	Run controlled A/B Vitest suites comparing `['nature']` vs `['food', 'culture']` on Pantabangan and Cabanatuan City.
TASK-05 **P1** *Low*	BUG-05 & BUG-06: Custom Builder Step 1 → Step 2 Category Mapping & Full LGU Catalog Load	Map Step 1 `'culture'` and `'resort'` selections to dedicated Step 2 filter tabs (or include `museum_cultural`, `church_religious`, and `resort_swimming` in `'Tourist Spots'`), and update `loadBrowsePlaces()` (`line 867`) to query all POIs in the selected municipality.	`Project/src/app/features/itinerary/custom-builder/custom-builder.page.ts` *Deps:* TASK-02	Selecting `Culture & History` or `Resort` in Step 1 displays matching museums, churches, and resorts in Step 2; Step 2 loads the selected municipality's full POI pool.	Test Step 1 → Step 2 transition for `'Cabanatuan City'` with `'Culture & History'` and verify >10 matching venues appear immediately.

Task ID / Prio / Comp	Problem Addressed	Recommended Solution	Affected Files & Dependencies	Acceptance Criteria	Suggested Regression Tests
TASK-06 **P1** *Low*	BUG-07 & BUG-08: Hydrate `ne_default_budget` and `ne_theme_mode` Across App Boot & Wizards	Read `ne_theme_mode` in `AppComponent.ngOnInit()` (and `index.html`) on startup, and read `ne_default_budget` when initializing `dailyBudget` controls in `SuggestedWizardPage` and `CustomBuilderPage`.	`Project/src/app/app.component.ts`, `suggested-wizard.page.ts`, `custom-builder.page.ts` *Deps:* None	Enabling Dark Mode persists across full page reloads (`F5`) on any route; saving a Default Budget in Profile pre-fills both itinerary wizards.	Set `ne_theme_mode = 'dark'` and `ne_default_budget = '2500'` in `localStorage`, reload `/tabs/home`, and verify dark class and `2500` wizard budget.
TASK-07 **P1** *Medium*	BUG-11: Persistent Cloud Backend Hosting & Production JWT Secret Guard	Deploy FastAPI + PostgreSQL to a persistent cloud host (Render/Koyeb + Neon) or configure the Cloudflare Worker proxy (`cloudflare-worker/`), update `environment.prod.ts`, and add a fail-fast Pydantic validator in `backend/app/core/config.py` rejecting default `jwt_secret_key` in production.	`Project/src/environments/environment.prod.ts`, `backend/app/core/config.py`, `cloudflare-worker/` *Deps:* TASK-01	Opening https://edselrenz.github.io/Itinerary-App/welcome on any ISP connects to the live API without DNS changes or manual tunnel entry; backend refuses non-dev startup if `jwt_secret_key` is default.	Verify `GET /api/v1/health` returns `200 OK` from default ISP DNS and test `config.py` startup validation with `APP_ENV=production`.
TASK-08 **P2** *Low*	BUG-09: Unify Online & Offline 2,673-POI Catalog in `PlaceService`	Update `PlaceService.getPlaces()` and `searchPlaces()` (`place.service.ts:113-169`) to merge backend responses with deduplicated `osm_places.json` entries so online queries never truncate to 100 items.	`Project/src/app/core/services/place.service.ts` *Deps:* TASK-07	Both online and offline calls to `PlaceService` expose the full 2,673+ Nueva Ecija POI catalog without artificial 100-item truncation.	Unit test `PlaceService.searchPlaces()` with a mocked 100-item API response and verify merged output retains full local LGU coverage.

Task ID / Prio / Comp	Problem Addressed	Recommended Solution	Affected Files & Dependencies	Acceptance Criteria	Suggested Regression Tests
TASK-09 **P2** *Low*	BUG-10: Dynamic Day Subtitles & 'Flexible Time/Budget' Labels in `ItineraryDetailPage`	Replace hardcoded `'12:00 PM - 2:00 PM'`, `'₱ 3,000 - ₱ 5,000/day'`, and `'Food spots, local culture...'` fallback strings in `itinerary-detail.page.ts:171, 201-215` with dynamic stop-category summaries and `'Flexible time'` / `'Flexible budget'`.	`Project/src/app/features/itinerary/itinerary-detail/itinerary-detail.page.ts` *Deps:* TASK-03	Custom stops without `planned_time` display `'Flexible time'`; zero-budget trips display `'Flexible Budget'`; day subtitles dynamically list the day's actual stop categories.	Render a custom itinerary with nature-only stops and empty `planned_time` and verify subtitle and time labels.
TASK-10 **P2** *Low*	BUG-12: Responsive Expansion of Home Popular Destination Cards	Widen `.dest-card` in `home.page.scss:241` from `120px` to `165px`, add a 2-line title clamp, and render municipality + category badges on each card.	`Project/src/app/tabs/home/home.page.scss`, `home.page.html` *Deps:* None	Popular Destination cards on `/tabs/home` display readable venue titles, municipality tags, and category badges across 320px–430px viewports.	Inspect `/tabs/home` at `320×568` and `375×812` viewports to confirm zero awkward word clipping.
TASK-11 **P3** *Low*	BUG-13: Asset Cleanup, `.gitignore` Hygiene & Indexed LGU Lookup	Delete the 44 unused SHA-1 image files in `Project/src/assets/images/`, remove `.VSCodeCounter/` and add it to `.gitignore`, and pre-index `osm_places.json` by municipality key in `PlaceService`.	`Project/src/assets/images/`, `.gitignore`, `Project/src/app/core/services/place.service.ts` *Deps:* None	Production build (`Project/www`) contains zero unreferenced image files, `.VSCodeCounter/` is untracked, and municipality lookups run in O(1) map lookup time.	Run `npm run build` in `Project/` and verify reduced bundle size and clean `git status`.

Task ID / Prio / Comp	Problem Addressed	Recommended Solution	Affected Files & Dependencies	Acceptance Criteria	Suggested Regression Tests
TASK-12 **P3** *Low*	BUG-14 & CI Gate: Open Graph SEO Tags, `/tabs/saved` Alias & CI Test Gate	Add `<meta name='description'>` and Open Graph tags to `Project/src/index.html`, alias `/tabs/saved` → `/tabs/history` in `tabs.routes.ts`, and add `npm test -- --watch=false` and `pytest` steps to `.github/workflows/deploy.yml`.	`Project/src/index.html`, `Project/src/app/tabs/tabs.routes.ts`, `.github/workflows/deploy.yml` *Deps:* TASK-01 to TASK-11	Social link previews render title/description/image metadata, `/tabs/saved` redirects to `/tabs/history`, and GitHub Actions blocks deployment if any Vitest or Pytest check fails.	Inspect compiled `index.html` head tags and trigger `.github/workflows/deploy.yml` in GitHub Actions.
